

Name of app: Today.

By Markus Lim

Starting the application:

While in the today-api folder, run heroku local -f "Procfile.dev"

Summary:

Admittedly as I write this summary, I realise I really should have started working on this assignment earlier instead of rushing it the last few days(the exact same folly I made for the mid assignment which I told myself I would not make again sigh). So much stuff I thought I could cram in time but wow, my estimation was really off. Nonetheless, I feel proud of how far I've come and especially the things I've learnt. Building an application from the ground up has always seemed like an immense task and without the initial knowledge or commitment, I would get nowhere with it. However, this assignment if anything has taught that just getting started is the key.

My application is called "Today.", a sort of minimalistic todo app with a really simple design. Features include:

1. A login/Signup page
2. The main application which is the Todo List

(Currently all accounts link to the same Todo List, had no time to implement it properly :P)
(Sample account – Username: sample Password: sample)

In the todo list, I tried to reduce the amount of buttons so it would look as simple as possible. So to add an item, you simply just start typing at the top of the List and press "enter" to record it. You can also edit a Todo item simply by tapping on it and clicking away or pressing "enter" when you are done. And when you want to check an item as "done" you simply hit the checkbox and it will no longer be editable and will be strike-throughed. Deleting the task is as simple as clicking the Delete Icon on the right of each task.

Large space on the right was actually for a "Quote of the day" kinda thing which again I could not implement in time :P. I figured it would be better to improve on the looks and feel of the application and overall quality of the code rather than cram as much features inside.

Anyway, that's all for my application 😊
